choice diagram

We have to return the max profit so return type would be int.

Base cond<sup>n</sup> → think of the smallest valid ip.

IP wt[]:  ] → 0 → 0.  
val[]: 

W: 10 kg → 0 kg

max profit

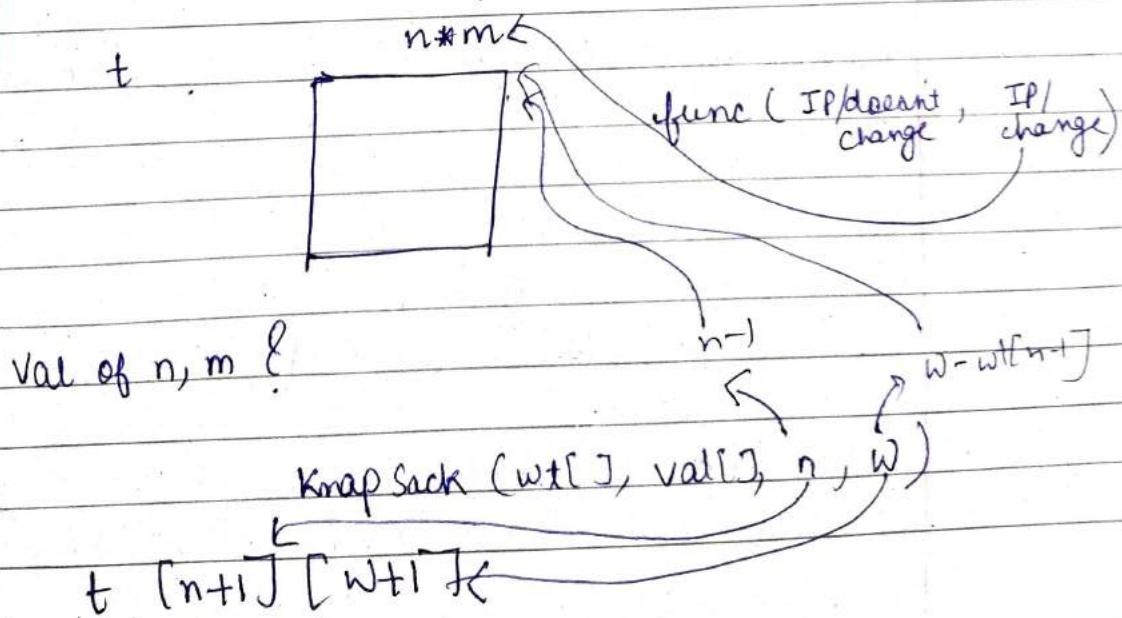

```
int knapsack( int wt[], int val[], int w, int n ) {  
    // base condition  
    if (n == 0 || w == 0)  
        return 0;
```

// choice diagram

if (wt[n-1] <= w) { → weight vs gain  
 return val[n-1] + knapsack(wt, val, w - wt[n-1])  
} else if (wt[n-1] > w) { weight less than  
 but don't include  
 return knapsack(wt, val, w, n-1);  
}

## Q1 Knapsack Memoization

Memoization = Recursive + 2 lines

	-1	-1	-1	-1	-1	
n+1	-1	-1	-1	-1	-1	
	-1	-1	-2	-1	-1	
	-1	-1	-1	-1	-1	
	-1	-1	-1	-1	-1	
	-1	-1	-1	-1	-1	
	-1	-1	-1	-1	-1	

if (-1) is not present then val exists so, return

initialise this matrix with -1.

```
int t[n+1][w+1]
memset(t, -1, sizeof(t))
```

Change

Now declare the matrix globally.

```
int static t[102][1002]; constraint
n <= 100
w <= 1000
memset(t, -1, sizeof t)
```

```
int knapsack (int wt[], int val[], int w, int n)
{
```

if (n == 0 || w == 0)

return 0;

if (t[n][w] != -1)

return t[n][w];

if (wt[n-1] <= w)

return t[n][w] = max (val[n-1] + knapsack(wt, val, w-wt[n-1],

knapsack(wt, val, 0, n-1));

else if ( $wt[n-1] > w$ )

return  $t[n][w] = \text{Knapsack}(wt, val, w, n-1)$ ;

}

The complexity of top down & memoization remains same but the problem with memoization is the stack gets full due to repeated funcn' calls.

### Further Optimization

Why the above code is not most optimized?

Since we are calling

$\text{int temp} = 1 + \text{solve}(s, i, k) + \text{solve}(s, k+1, j)$

$\begin{matrix} \text{R.C} \\ (\text{left}) \end{matrix} \quad \begin{matrix} \text{R.L} \\ (\text{right}) \end{matrix}$

There is a possibility, might be one of the R.C is solved or called.

The code will remain same but the diff is

$\text{int temp} = 1 + \text{solve}(s, i, k) + \text{solve}(s, k+1, j)$

if ( $t[i][k]$ ) = -1

left =  $t[i][k]$

else

left =  $\text{solve}(s, i, k)$

$t[i][k] = \text{left}$

if ( $t[k+1][j]$ ) = -1

right =  $t[k+1][j]$

else

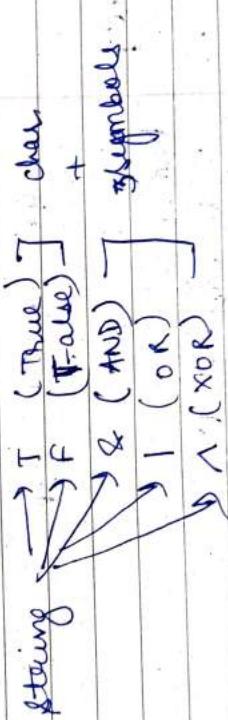

```
right = value(s, k+1, j)
    + [k+1:j] = right.
```

```
int temp = 1 + left + right;
